Pig Feeder Bait Station

- Protects non-target species from accessing Bait-Rite for pigs.
- Bait stations are designed so they self-close after pigs have taken bait. This is a legal requirement under the ACVM Act 1997.
- Bait Stations can be constructed from a variety of materials, providing they house the bait and self-close after pigs feed; an example is shown in the photo.
- Bait Stations need to be robust and well anchored once placed to withstand multiple pigs feeding and jostling at the station at one time.
- Materials - H4 treated radiata timber or similar is recommended as it needs to be robust to withstand multiple pigs feeding at one time and withstand the elements. Hinge lid with x 5 galvanised brackets and screws.
- Plans are also available on request.

Possum Philproof Bait Stations

- Designed for presenting poison or prefeed baits for possums.
- Large holds 1.6kg of bait and Mini holds 800 grams.
- Heavy duty with removable base for refilling and fully waterproof.
- White translucent colour makes them easy to see in the field and to check bait levels at a glance.
